Learning
Takeaways

**Do You Know about
unemployment rate in
Indonesia?**

&

**How can data help us
analyze and recommend to
find a job?**

Project Background:

Problem we're trying to solve

According to BPS RI data, Indonesia's unemployment rate is **5.83 percent** of the entire population of Indonesia as of February 2022. The unemployment rate is dominated by women.

Reinforced by the McKinsey & Company report, **the ratio of women working in corporations is still lower than men.** The **higher** the position, the **smaller** the proportion of women occupying the position.

Project Background

Our Project to solve The Problem!!

We made **an analysis** in the form of **dashboard visualization**, regarding the **Inequality of women and men** in terms of **fulfilling their life needs (work)**.

The dashboard visualization expected to **help women in finding solutions to overcome job equality**. As well as a **recommendation system** to help women find jobs that match their qualifications.

Project Background

The expected benefits of the project

→ Comparing the required qualifications and analyzing the causes of the gap between men and women in the world of work

→ Increasing productivity and work skills needed in today's industry and eliminating the patriarchal view that women are better off working in the informal sector.

Problem Formulation

TYPE HERE

**The formulations of the problem
that we raise in this project**

Tech Use

The Technology stack in this project :

Google Data Studio is used as software that helps in visualizing data. With this software, visualizations can be viewed interactively and are expected to be more easily understood by the audience.

Python is a programming language used for data processing. The dominant Python libraries supporting our processing are pandas, numpy, seaborn, textblob, and nltk.

Considerations for using the Python language because Python is a high-level programming language, which means this language is almost close to human language. Also supported by the availability of many open source libraries that help in data processing, analysis, recommendation systems or visualization.

Impact of Our Project

The expected benefits of the dashboard visualization will contain two things:

1. Our analysis of the gap between women and men in Indonesia.
2. Create a recommendation system to find the skills needed to apply for a job, minimum qualifications if you want to apply for a particular job, and choose the desired job based on the skills possessed by the user.

DEMO TIME!

Learning Takeaways

Technical Skills that we learned in This Project

- Data Collection
- Data Analyst
- Data Visualization in google data Studio

Soft Skills that we learned in This Project

- Team Work
- Time Management
- Critical Thinking
- Problem Solving

Learning Takeaways From Generasi Gigih 2.0

Technical Skills and soft skills that we learned in Generasi Gigih 2.0

- **Adaptability**
-
- Problem Solviing

Thankyou !
